

STATISTICAL BRIEF #335

July 2011

The Long-Term Uninsured in America, 2006-2009 (Selected Intervals): Estimates for the U.S. Civilian Noninstitutionalized Population under Age 65

Jeffrey A. Rhoades, PhD and Steven B. Cohen, PhD

Introduction

Estimates of the health insurance status of the U.S. civilian noninstitutionalized population are critical to policymakers and others concerned with access to medical care and the cost and quality of that care. Health insurance helps people get timely access to medical care and protects them against the risk of expensive and unanticipated medical events. When estimating the size of the uninsured population, it is important to consider the distinction between those uninsured for short periods of time and those who are uninsured for several years.

Using information from the Household Component of the Medical Expenditure Panel Survey (MEPS-HC) for 2008 and 2009, this Statistical Brief provides detailed estimates for the U.S. civilian noninstitutionalized non-elderly (under age 65) population that was uninsured for the entire 2006–2009 period and identifies groups most at risk of lacking any coverage during that four-year period. The inclusion of questions in MEPS to determine health insurance coverage profiles for the period covering 2006 and 2007, in concert with information on health insurance profiles from the National Health Interview Survey for 2007, facilitated these analyses of extended longitudinal profiles. All differences between estimates discussed in the text are statistically significant at the 0.05 level unless otherwise noted.

Findings

According to the MEPS-HC for 2008 and 2009, 34.6 percent (92.2 million people, estimate not shown) of the under-65 population was uninsured for at least one month during the two-year period (calendar years 2008 and 2009), and 12.3 percent (32.9 million people, estimate not shown) was uninsured for the entire two-year period. Just over two-thirds of those individuals lacking coverage for all of 2008–2009 were also without coverage for the entire prior 2006–2007 two-year period. This translates to 8.4 percent (22.3 million people, estimate not shown) of the total population under age 65 being uninsured for the entire four-year period from 2006 through 2009.

The age groups 18 to 24 and 25 to 29 were the most likely to be uninsured for some time during 2008 to 2009. For persons 18 to 24 and 25 to 29, 60.5 and 49.2 percent were uninsured for at least one month or more, respectively (figure 1). Children less than 18 were the least likely to be continuously uninsured for the full two-year period from 2008–2009 as well as for the entire 2006–2009 four-year period. Only 2.8 percent of children less than 18 years were uninsured for the entire 2006–2009 four-year period.

Individuals reported to be in excellent or very good health status were the least likely to be uninsured for some time during 2008 to 2009. For those in excellent health, 30.8 percent were uninsured at least one month; while for those in very good health, 33.4 percent were uninsured at least one month over the same time period (figure 2). Just under two-thirds of the 17.0 percent of individuals in fair or poor health lacking coverage for all of 2008–2009 were also without coverage for the entire prior two-year period from 2006 to 2007. This translates to 11.1 percent of the total population under age 65 in fair or poor health being uninsured for the entire 2006–2009 four-year period.

Highlights

- Approximately 22.3 million people, 8.4 percent of the population under age 65, were uninsured for the four-year period from 2006 through 2009. The percentage of long-term uninsured exceeded 10 percent for adults 18-24, 25-29, 30-34, 35-54 (10.9, 15.2, 12.8, and 10.4 percent, respectively).
- During 2008 to 2009, adults ages 18 to 24 and 25 to 29 were the most likely to be uninsured for at least one month (60.5 and 49.2 percent, respectively). Children under age 18 were the least likely to be uninsured for 2006-2009 (2.8 percent).
- Individuals reported to be in excellent or very good health status were the least likely to be uninsured for at least one month during 2008 to 2009 (30.8 and 33.4 percent, respectively).
- Hispanics were most likely to be uninsured for at least one month during 2008 to 2009 (52.3 percent) and for 2006-2009 (18.7 percent).
- Hispanics were disproportionately represented among the long-term uninsured. While they represented 17.1 percent of the population under age 65, they represented 38.3 percent of the long-term uninsured for 2006-2009.
- Individuals who were poor, near poor, and low income were represented disproportionately among the long-term uninsured. While poor individuals represented 14.9 percent of the population under age 65, they represented 29.1 percent of those uninsured for 2006-2009.

Among people under age 65, Hispanics were substantially more likely than black non-Hispanics single race, white non-Hispanics single race, Asian or Pacific Islander non-Hispanics single race, or other single race/multiple race non-Hispanics to lack health insurance during the time intervals under consideration. Among Hispanics under age 65, 52.3 percent were uninsured for at least one month, while 24.1 percent were uninsured for the entire 2008–2009 two-year period (figure 3). Over three-fourths of those Hispanic individuals lacking coverage for all of 2008–2009 were also without coverage for the entire prior four-year period from 2006 to 2009. This translates to 18.7 percent of the total Hispanic population under age 65 being uninsured for the entire 2006–2009 four-year period.

Hispanics were represented disproportionately among the long-term uninsured. While Hispanics represented 17.1 percent of the population under age 65, they represented 38.3 percent of the long-term uninsured for the period 2006–2009 (figure 4). Conversely, while white non-Hispanics single race represented 62.9 percent of the under 65 population, they represented only 44.6 percent of the long-term uninsured for the period 2006–2009. Furthermore, for individuals with no coverage for the entire period 2008–2009, Hispanics were more likely to be represented in the subgroup having no coverage for the entire 2006–2009 four-year period (38.3 percent) than the subgroup that had acquired some health insurance coverage in the prior period 2006–2007 (23.3 percent).

Individuals who were poor (i.e., persons in families with income equal to the poverty line or less), near poor, and low income were represented disproportionately among the long-term uninsured. While poor individuals represented 14.9 percent of the population under age 65, they represented 29.1 percent of those uninsured for the entire 2006–2009 four-year period (figure 5). Alternatively, while individuals with high incomes (i.e., persons in families with income over 400 percent of the poverty line) represented 34.8 percent of the population under age 65, they accounted for only 9.4 percent of those uninsured for the entire 2006–2009 four-year period. Furthermore, for individuals with no coverage for the entire 2008–2009 period, high income individuals were more likely to be represented in the subgroup that had some prior health insurance coverage in the prior period 2006–2007 (24.6 percent) relative to those individuals with no coverage for the entire 2006–2009 four-year period (9.4 percent).

Data Source

The estimates shown in this Statistical Brief are drawn from analyses conducted by the MEPS staff from the following MEPS public use files: 2008 Full Year Consolidated Data File (HC-121); 2009 Full Year Population Characteristics File (HC-123); and the MEPS Panel 13 Longitudinal Data File (December 2011) (HC-130). In addition, linkage of the MEPS sample to the 2007 National Health Interview Survey was undertaken for this Statistical Brief.

Definitions

Population covered

Persons included in this analysis were present for the entire two-year reference period, 2008–2009.

Uninsured

People who were covered only by non-comprehensive state-specific programs (e.g., Maryland Kidney Disease Program) or private single service plans (e.g., coverage for dental or vision care only, coverage for accidents or specific diseases) were considered to be uninsured. Those sample persons identified as being uninsured on January 1, 2008, in MEPS were asked if they were covered by a health insurance plan or program at any time in 2006 or 2007 in order to determine their health insurance status over the 2006–2009 four-year period. Linkage was established with the 2007 National Health Interview Survey for sample persons uninsured for all of 2008–2009 to further edit their health insurance status prior to 2008.

Age

Age was defined as age at the end of 2008.

Race/ethnicity

Classification by race/ethnicity was based on information reported for each family member. Respondents were asked if each family member's race was best described as American Indian, Alaska Native, Asian or Pacific Islander, black, white, or other. They also were asked if each family member's main national origin or ancestry was Puerto Rican; Cuban; Mexican, Mexicano, Mexicano, Mexicano, or Chicano; other Latin American; or other Spanish. All persons whose main national origin or ancestry was reported in one of these Hispanic groups, regardless of racial background, were classified as Hispanic. Since the Hispanic grouping can include black Hispanic, white Hispanic, Asian and Pacific Islanders Hispanic, and other Hispanic, the race categories of black, white, Asian and Pacific Islanders, and other do not include Hispanic. MEPS respondents who reported other single or multiple races and were non-Hispanic were included in the other category. For this analysis, the following classification by race and ethnicity was used: Hispanic (of any race), non-Hispanic blacks, non-Hispanic Asian and Pacific Islanders, and non-Hispanic others.

Poverty status

Sample persons were classified according to the total yearly income of their family. Within a household, all people related by blood, marriage, or adoption were considered to be a family. Poverty status categories are defined by the ratio of family income to the federal income thresholds, which control for family size and age of the head of family. Poverty status was based on annual income in 2008.

Poverty status categories are defined as follows:

- Poor: Persons in families with income less than or equal to the poverty line, including those who had negative income.
- · Near poor: Persons in families with income over the poverty line through 125 percent of the poverty line.

- . Low income: Persons in families with income over 125 percent through 200 percent of the poverty line.
- Middle income: Persons in families with income over 200 percent through 400 percent of the poverty line.
- High income: Persons in families with income over 400 percent of the poverty line.

Health status

In every round, the respondent was asked the following question to rate the health of every member of the family: "In general, compared to other people of (PERSON)'s age, would you say that (PERSON)'s health is excellent, very good, good, fair, or poor?" For this Brief, the response categories "fair" and "poor" were collapsed.

About MEPS-HC

MEPS-HC is a nationally representative longitudinal survey that collects detailed information on health care utilization and expenditures, health insurance, and health status, as well as a wide variety of social, demographic, and economic characteristics for the U.S. civilian noninstitutionalized population. It is cosponsored by the Agency for Healthcare Research and Quality and the National Center for Health Statistics.

For more information about MEPS, call the MEPS information coordinator at AHRQ (301) 427-1406 or visit the MEPS Web site at http://www.meps.ahrq.gov/.
