

STATISTICAL BRIEF #413

June 2013

Prescription Drug Expenditures in the 10 Largest States, 2010

Frederick Rohde, MA

Introduction

In 2010, prescription drugs accounted for 21.4 percent of overall health care expenditures among the U.S. civilian noninstitutionalized population. Prescription drug expenses were incurred by 61.3 percent of the population, and among those with expenses, the average annual expense amount was \$1,432.

Prescription drug expenditures are distinguished from overall health care expenditures in the distribution by sources of payment. A higher percentage of prescription drug expenses was paid out of pocket (21.8 percent for drugs versus 14.2 percent overall) and a lower percentage was paid by private insurance (33.3 percent versus 40.1 percent) in 2010. Prescription drug and overall expenses have similar percentages paid by Medicare (24.8 percent versus 25.7 percent) and Medicaid (11.3 percent versus 10.4 percent) in 2010 (data in overall category not shown).

Many factors can influence health care expenses in a particular state, including the demographic, socioeconomic, and health status characteristics of the population. Further, the prevalence and types of health insurance coverage in a state can impact access to care, the level of expenditures, and the extent to which different sources finance health care services.

This Statistical Brief presents estimates based on data from the Household Component of the Medical Expenditure Panel Survey (MEPS-HC) on the use, expenditures, and sources of payments for prescription drug expenditures for persons in the U.S. civilian noninstitutionalized population in 2010 for the 10 largest states, and compares the results to the national average in 2010. Only those estimates with statistically significant differences from the national average using a multiple comparison procedure at the .05 significance level are noted in the text.

Highlights

- In 2010, prescription drugs represented 21.4 percent of all medical expenditures.
- Compared to the national average, the percentage of people with prescription drug expenses was lower in California, Texas, New York, and Florida.
- Among people with prescription drug expenses, the average annual amount in 2010 was lower in Texas compared to the national average.
- In 2010, the percentage of drug expenses paid by private insurance in these 10 states was similar to that for the U.S. as a whole; however, the percentage paid by Medicare and by Medicaid was lower in Georgia, and the percentage paid out of pocket was lower in California, New York, and Michigan.

Findings

In 2010, 61.3 percent of the U.S. civilian noninstitutionalized population had expenditures for prescription drugs (figure 1). This was lower in California (47.7 percent), Texas (53.1 percent), New York (53.4 percent), and Florida (58.1 percent).

Among persons with prescription drug expenses in the U.S. in 2010, the average expenditure per person was \$1,432 (figure 2). This amount was lower in Texas (\$1,090).

Nationally, 33.3 percent of prescription drug expenditures were paid by private insurance in 2010 (figure 3). The percentages in these 10 states were not statistically different.

In 2010, Medicare and Medicaid paid for 24.8 and 11.3 percent, respectively, of prescription drug

expenses in the U.S. (figure 3). The percentages paid by these sources were lower in Georgia (15.4 percent Medicare, 6.5 percent Medicaid).

In the U.S., 21.8 percent of prescription drug expenses were paid out of pocket in 2010 (figure 3). The percentage paid out of pocket was lower than the U.S. average in California (16.5 percent), New York (15.6 percent), and Michigan (16.2 percent).

Data Source

The estimates shown in this Statistical Brief are drawn from analyses conducted by MEPS staff using expenditure data from the following public use file: 2010 Full Year Consolidated File, HC-138.

Definitions

Expenditures

Expenditures include total payments from all sources to hospitals, physicians, other health care providers (including dental care and home health), pharmacies, and providers of other medical equipment for services reported by respondents in the MEPS-HC. Sources include direct payments from individuals, private insurance (including TRICARE), Medicare, Medicaid, and various other sources (including the Department of Veterans Affairs, Workers' Compensation, and miscellaneous public sources).

Prescription medicine expenditures

This subcategory of expenditures includes those for all prescribed medications initially purchased or otherwise obtained during the year, as well as any refills.

About MEPS-HC

MEPS-HC is a nationally representative longitudinal survey that collects detailed information on health care utilization and expenditures, health insurance, and health status, as well as a wide variety of social, demographic, and economic characteristics for the U.S. civilian noninstitutionalized population. It is cosponsored by the Agency for Healthcare Research and Quality and the National Center for Health Statistics.

For more information about MEPS, call the MEPS information coordinator at AHRQ (301-427-1406) or visit the MEPS Web site at <http://www.meps.ahrq.gov>.
